3. REQUIREMENTS.

3.1 GENERAL SPECIFICATION. Unless otherwise specified herein, all of the requirements of Specification ND-1002210 shall apply as requirements of this specification.

3.2 DESCRIPTION. The assembly shall be used in the Power and Servo Assembly as an impedance isolating and phase correction device between the hand controller transmitter and the one-speed resolver.

3.3 FUNCTIONAL REQUIREMENTS

3.3.1 Electrical Inputs. The assembly shall perform as specified herein under the simulated operating conditions specified by Figure 1 and as follows:

a. DC Supply Voltage: 25 to 31 vdc, noise <1 mv rms.
b. Input Signal: 800±2 cps, variable voltage, distortion < 2%, impedance <2K Ω.

3.3.2 Insulation Resistance. The resistance between the assembly pins and the assembly mounting screws shall be equal to or greater than 100 megohms.

3.3.3 Current Drain. **The dc current drain of the module shall be a maximum of 36 ma.**

3.3.4 Noise. The output noise of each amplifier shall not exceed 5 mv rms.

3.3.5 Gain. The gain of each amplifier with the adjacent amplifier input terminals grounded shall be 1.1±10 percent

3.3.6 Distortion. The load voltage distortion of each amplifier with the adjacent amplifier input terminals grounded shall be less than 5 percent at supply voltages of 25.0±0.3 vdc, 28.0±0.3 vdc and 31.0±0.3 vdc.

3.3.7 Phase Shift. The phase shift between input and output of each amplifier, with the adjacent amplifier input terminals grounded, shall be 172.5° ±3.0°.

3.3.8 Input Impedance. The input impedance shall be >185KΩ.

3.4 PERFORMANCE AND PRODUCT CHARACTERISTICS

3.4.1 Service Life

3.4.1.1 Operating Life. The assembly shall meet performance specifications for at least 2000 hours of operation, excluding the supplier's test time of the completed unit.

3.4.1.2 Shelf Life. The assembly shall have a shelf life of at least 5 years, without operation at ambient room temperature after final acceptance at the supplier's facility.

3.4.2 Reliability. Design objectives require maximum reliability of the assembly during its period of useful life. Every effort shall be made to design and produce units capable of **meeting a maximum failure rate of 2.2 failures per million hours.**

CONFIGURATION, PROCESS AND QUALITY CONTROL

REQUIREMENTS FOR SUPPLIERS OF HIGH RELIABILITY ARTICLES FOR USE IN APOLLO GUIDANCE AND NAVIGATION SYSTEMS

1. SCOPE

1.1 OBJECTIVE. This specification covers the general requirements for configuration, process, and quality control to be followed by suppliers of parts, materials and other articles intended for use in the Apollo Guidance and Navigation Systems. Long mission times, the safety and the lives of American Astronauts necessitates the attainment of the highest practicable degree of reliability. Therefore, more stringent requirements than heretofore must be imposed on all contractors involved in any way with the generation of Apollo hardware. This occurs chiefly in the area of strict configuration and process control. Prompt and effective corrective action directed towards the elimination of known failure mechanisms and manufacturing variances are also vital elements of the program. The qualification of the particular part, material or article for the Apollo mission will be obtained through the test program and early unmanned and manned flights. This validation and continued confidence in the reliability and quality levels of the item must be maintained by assuring similarity between the first and last produced. Maximum controls of process and configuration are essential to this as would be carefully evaluated corrective action resulting in part or process improvement. Supplier and contractor compliance in the spirit of this specification is vital to the success of the program.

1.2 PROPRIETARY RIGHTS. It is not the intent of this document to encroach upon proprietary rights of suppliers. Therefore, the provisions of this specification requiring disclosure either by documentation or inspection shall not apply to those manufacturing processes, equipments, materials, tests, inspections, or areas of design which have been negotiated between supplier and purchaser as proprietary. This does not however, exempt the suppliers from compliance to other aspects of this specification in areas

Changes to design, processes, or materials deemed proprietary in nature need not be disclosed but notice that a change is contemplated and a discussion of its effect on the article shall be made in advance to the purchaser. Aspects, of design, materials and processes identified thereupon as non-critical may be modified at the discretion of the supplier. Whenever a proposed change in process or design is approved, the old process or design shall also be kept in file for reference if the hardware involving the process or design has at any time been accepted by the purchaser. The requirement for maintenance of documentation shall be automatically discontinued three (3) years after last article acceptance by the purchaser unless otherwise negotiated. The above shall apply to lower tier supplier when lower tier supplier's process or materials have been deemed critical.

3.3.5 SUPPLIER PROPOSED CHANGES. The supplier shall provide the purchaser with the engineering reasons and full details of any proposed change as described above. If a change is considered unacceptable by the purchaser, he may cancel his order if the supplier cannot revert his production to the original configuration. When a change is considered by the purchaser to be acceptable but to have no effect on interchangeability or reliability, the supplier shall incorporate the approved change in the article without changing the model or part number. Break in and effectivity of approved changes shall be keyed to the supplier's serialization or lot control for purposes of traceability. When a change is considered by the purchaser to be acceptable but to have an effect on interchangeability, form, fit, function, quality, or reliability, the supplier may incorporate the approved change but shall be required to provide a new model or part numbers for the article which contains or incorporates the approved change. The supplier's engineering drawings and other governing documents shall be revised to reflect all changes approved and incorporated in the article. The purchaser shall afford due consideration to all changes proposed by the supplier and shall provide a prompt disposition of such requests. If a change results in a new or revised model or part numbers, the supplier shall not furnish such new articles to the purchaser prior to the receipt of a new or modified purchase order calling for the newly identified article. Producibility and reliability shall be established by a pilot line or pilot production run in the event of substantial changes in design, materials or processes.

3.3.6 MAINTAINING QUALIFICATION. Whenever possible, the purchaser will maintain a sample of the most recently qualified configuration of the article. It shall be the prerogative of the purchaser to select, at any time, a sample of incoming material from any shipment for purposes of testing, dismantling, comparison with the qualified sample, or any combination of these operations. If the inspection reveals the presence of an unauthorized change as defined above, the purchaser may purchaser may reject the entire shipment and shall reserve the right to withdraw qualification approval. Any requalification testing deemed necessary by the purchaser under these conditions shall be the responsibility of the supplier. The purchaser reserves the right to cancel orders without cancellation charges whenever previous qualification is invalidated through unauthorized changes; this shall also apply to supplies accepted by the purchaser under the purchase order prior to discovery of the unauthorized change, which are returnable for credit regardless of condition.

3.3.7 AGE CONTROL. The supplier shall inform the purchaser in writing of any materials and articles having known characteristics of quality degradation of drift with age and/or use and these materials and articles shall be marked to indicate the date and test time or cycle the critical life was initiated or the date and test time or cycles at which useful life will be expended. Variables data shall be recorded and maintained; if required by the applicable drawing, variables data shall be furnished to the purchaser.

3.3.8 IDENTIFICATION AND TRACEABILITY. The supplier shall maintian a lot identification or serialization program designed to facilitate future traceability and isolation of articles of the same design, configuration, and materials. The program shall generally permit the determination of the following information for a specific part:

a. Date of article manufactured.

b. Production lines on which the article or its subassemblies were manufactured, if more than one involved.

c. Inspectors and inspection stations through which the articles or its subassemblies passed.

d. Operators and other personnel responsible for the manufacture of the article or its components.

e. Lot or serial numbers of critical raw materials and components and/or identification of articles simultaneously subjected to critical processing.

If lot identification is used, marking each part with a lot code number or symbol shall be a part of the lot control program. The supplier's shipping documents or certification on each shipment shall also bear reference to this particular lot identification marking. Other characteristics of the supplier's lot identification program may be developed by the supplier to suit his operations. However, adequacy of the program shall be assessed by the purchaser at time of documentation negotiation and the supplier shall furnish the purchaser documentation describing in detail this program.

3.4 CLASS 1

3.4.1 GENERAL. The supplier shall comply with the requirements of Class 2 and the following provision of this section.

3.4.2 DOCUMENTATION. The supplier shall select one of the following two options to assure documentation control:

a. A complete set of drawings, process descriptions, and other related documents as enumerated in paragraph 3.3.4 shall be supplied to the purchaser. After delivery of governing documentation, no changes or alterations, however slight, shall be made in processes, designs, or materials without prior written concurrence of the purchaser.

b. A complete set of documentation as emmerated in paragraph 3.3.4 shall be placed in a bonded file (see 6.1.3).

4. QUALITY ASSURANCE PROVISIONS. This section is not applicable to this specification.

5. PREPARATION FOR DELIVERY. This section is not applicable to this specification.

6. NOTES

6.1 DEFINITIONS

6.1.1 SUPPLIER. A contractor or subcontractor actually performing the services or producing the contract articles.

6.1.2 PURCHASER. Any agency initiating a purchase order, work statement or contract for the procurement of articles or supplies.

6.1.3 BONDED FILE. A bonded file is a supplier's file containing a purchaser's lock and which can be opened only by the purchaser or his representative. The supplier may also lock this file at his option.

6.1.4 FLOW CHART. For purposes of this specification the term Flow Chart as used in NPC 200-3 shall be construed to include such items as shop travelers, job cards, routings, or other manufacturing and inspection control documents which can be judged equivalent in effect.

GENERAL SPECIFICATION

CONFIGURATION, PROCESS AND QUALITY CONTROL

REQUIREMENTS FOR SUPPLIERS OF HIGH RELIABILITY ARTICLES FOR USE IN APOLLO GUIDANCE AND NAVIGATION SYSTEMS

1. SCOPE

1.1 OBJECTIVE. This specification covers the general requirements for configuration, process, and quality control to be followed by suppliers of parts, materials and other articles intended for use in the Apollo Guidance and Navigation Systems. Long mission times, the safety and the lives of American Astronauts necessitates the attainment of the highest practicable degree of reliability. Therefore, more stringent requirements than heretofore employed must be imposed on all contractors involved in any way with the generation of Apollo hardware. This occurs chiefly in the area of strict configuration and process control. Prompt and effective corrective action directed towards the elimination of known failure mechanisms and manufacturing variances are also vital elements of the program. The qualification of the particular part, material or article for the Apollo mission will be obtained through the test program and early unmanned and manned flights. This validation and continued confidence in the reliability and quality levels of the item must be maintained by assuring similarity between the first and last produced. Maximum controls of process and configuration are essential to this as would be carefully evaluated corrective action resulting in part of process improvement. Supplier and contractor compliance in the spirit of this specification is vital to the success of the program.

1.2 PROPRIETARY RIGHTS. It is not the intent of this document to encroach upon proprietary rights of suppliers. Therefore, the provisions of this specification requiring disclosure either by documentation or inspection shall not apply to those manufacturing processes, equipments, materials, tests, inspections, or areas of design which have been negotiated between supplier and purchaser as proprietary. This does not however, exempt the suppliers from compliance to other aspects of this specification in areas defined as proprietary and assurance or certification of such must be provided the purchaser. In the event elements of this specification requiring prior approval or advice concerning changes in configuration, process control or material are imposed on the supplier and a proprietary area is involved, the obligation to discuss the effect of the changes on the part or article still exists.

1.3 DEGREE OF CRITICALITY. The requirements of this specification are separated into three categories (Class 1, Class2, and Class 3) with Class 1 being the most stringent. The class applicable to the particular article will be stipulated on the drawing, the specification control drawing, or in the procurement documentation. The assignment of class is made on the basis of criticality in the application of the particular article. Those which by reason of their large population in the system or by singular application are potentially great contributors to mission unreliability are assigned the more stringent class.

AF SPEC. Bulletin NR-515, Control of Nonconforming Suppliers.

3. REQUIREMENTS

3.1. RELATION TO DETAIL REQUIREMENTS. The quality program requirements set forth in this publication shall be satisfied in addition to all detail requirements contained in the procurement documents or in other parts of the purchase order. To the extent of any inconsistency between the purchase order or its General Provisions and this publication, the purchase order and the General Provisions shall control. However, the supplier shall bring any area of conflict to the attention of the purchaser.

3.2 CLASS 3

3.2.1 The supplier's quality control system shall comply with the requirements of MIL-Q-9858 in conjunction with Air Force Specification Bulletin NR 515 and MIL-C-45662A and all the following provisions of this section.

3.2.2 SURVEYS and SURVEILLANCE. The supplier shall provide for and permit cognizant NASA or other governmental agency, their designated representatives, or the purchaser to survey the supplier's quality program, or inspection system and implementation thereof in order to verify compliance with this specification and adequacy. Reasonable notice of impending visits will be provided the supplier. The supplier shall provide assistance to the purchaser to effect a similar survey of his lower tier suppliers where such is deemed necessary.

3.2.3 RESUBMISSION OF REJECTED MATERIAL. All supplies' rejected for failure to comply with any provisions of the purchaser's specifications and subsequently resubmitted by the supplier shall bear identification of such resubmission either on the supplies or on the supplier's shipping document. Reference shall be made to the purchaser's receiving inspection descrepancy report and evidence shall be given that the causes for rejection have been corrected and that corrective action has been performed. Resubmitted material shall meet the procurement provisions. nt specified in the procurement

3.2.4 TESTING AND FINAL ACCEPTANCE. Product tests or inspection performed or observed by the purchaser shall not relieve the supplier of his responsibility to meet all his contractual requirements nor guarantee final acceptance. Final acceptance shall be accomplished only at the point specified in the procurement document.

3.2.5 EVIDENCE OF SUPPLIER INSPECTION PERFORMED. Prior to shipment, the supplier shall completely test each article or lot to the requirements of the applicable drawings and specifications and a copy of the test results shall be furnished to the purchaser upon request or as specified on the applicable drawing. Particular emphasis shall be given to those characteristics which cannot be normally inspected by the purchaser after receipt to the article. Inspection records maintained by the supplier shall be adequate enough to ascertain the quality level of the production precesses and of the resultant articles. Inspection records and test data shall be held by the supplier for a period of three years after last article acceptance by the purchaser unless otherwise negotiated. Inspection record or test data shall be available to the purchaser on request.

3.2.6 FAILED PART ANALYSIS. Upon request, the supplier shall perform failed part analysis and submit the results of the analysis to the purchaser within 30 days of the receipt of the failed part. The analysis shall include the mode of failure, probable cause, and recommendations as well as applicable supporting information, such as test results or photographs. Corrective action and pertinent break in information shall be initiated by the supplier.

3.2.7 NOTIFICATION OF TESTING. When specifically requested by the purchaser, the supplier shall provide reasonable notice of when tests are to be conducted and permit the NASA or other cognizant government agency, his designated representative, or the purchaser to witness same.

3.2.8 RAW MATERIAL CONTROL. The supplier shall maintain adequate controls over the receipt and storage of raw materials. The supplier shall, as a minimum, receive certificates of compliance for the chemical and physical properties of all raw materials.

3.2.9 AGE CONTROL. The supplier shall inform the purchaser in writing of any materials or articles having known characteristics of quality degradation or drift with age and/or use.

3.3 CLASS 2

3.3.1 GENERAL. The supplier shall comply with NPC 200-3 in lieu of MIL-Q-9858, the requirement for Class 3 above, and the following provisions of this section. Whenever NPN 200-3 requires submittal of documentation to NASA, the documentation shall be submitted to the purchaser and subject to his disapproval.

The supplier shall submit to the purchaser an inspection plan containing the elements outlined in NPC 200-3, paragraph 2.2.

3.3.2 RAW MATERIALS TESTING. The supplier shall periodically verify certifications through actual chemical and physical testing.

3.3.3 CONFIGURATION AND MANUFACTURING PROCESS CONTROL. The supplier shall certify in writing with each shipment that all articles furnished in accordance with the purchase order comply with all requirements of the drawings, this specification, and other applicable documents.

3.3.4 DOCUMENTATION. The supplier shall assure that the design, manufacturing processes, materials, and sources of materials used by him and his lower tier suppliers are fully controlled by drawings or an equivalent system of documemtation and that articles to be furnished shall be fabricated in compliance with the same. The supplier shall permit review by the NASA or other cognizant government agency, their designated representative, or the purchaser of above documentation as may not infringe upon proprietary rights and the opportunity to observe the manner in which it is implemented within the supplier's facilities. The supplier and purchaser shall jointly review process, configuration, fabrication and material control documentation and agree on features therein which are critical based on the purchaser's application. Following mutual agreement and determination of the adequacy of the supplier's control, the supplier shall henceforth make no changes or alterations in processes, design and materials affecting these critical areas without first advising the purchaser and obtaining prior written concurrence of the purchaser. A current list of all documentation governing these features shall be supplied to the purchaser and shall include:

1. An identifying number and description of each document.

3.3.4 Motor Starting Voltage. The in-phase voltage necessary to start and maintain motor shaft rotation shall not exceed 1.5V rms.

3.3.5 Motor Phasing. The CDU display shall increase when the control voltage is in-phase with the 0° reference and shall decrease when the control voltage is 180° out of phase with respect to the 0° reference.

3.3.6 Motor Speed. With rated voltage applied to all motor windings, the steady state motor speed shall be 11,000 ± 2500 rpm.

3.3.4 Motor Starting Voltage. The in-phase voltage necessary to start and maintain motor shaft rotation shall not exceed 1.5V rms for Type I and III, and 2.0V rms for Type II.

3.3.5 Motor Phasing. The CDU display shall increase when the control voltage is in-phase with the 0° reference and shall decrease when the control voltage is 180° out of phase with respect to the 0° reference.

3.3.6 Motor Speed. With rated voltage applied to all motor windings, the steady state motor speed shall be 11,000 ± 2500 rpm.

3.3.7 Tachometer Null. With the motor control voltage removed, the in-phase component of the tachometer output voltage shall be less than 4 mv rms, and the total tachometer voltage shall be less than 11 mv rms when the tachometer shaft is not rotating.

3.3.8 Tachometer Phasing. The tachometer output voltage shall be 180° out of phase with respect to the tachometer reference when the CDU display is increasing, and shall be in-phase with the tachometer reference when the CDU display is decreasing.

3.3.9 Motor Jog. With the motor shaft speed set at 50 ± 3 rpm, the variation from the set speed ~~shall not~~ exceed ±2 rpm.

3.3.10 Slew Voltage and Phasing For Type I and II. With the SLEW switch set in the "INC" position, the slewing transformer output shall be 6.25±1.00V rms, and in phase with the zero degrees reference. With the SLEW switch set in the "DEC" position, the slewing transformer output voltage shall be 6.25±1.00V rms, and 180° out of phase with the zero degrees reference.
reference.

3.3.11 Encoder Output Characteristics. With the motor driven at a constant speed each phase of the encoder output shall have the following characteristics.

3.3.11.1 Modulation Envelope Magnitude. The magnitude of the modulation envelope shall be greater than 125 mv pp, but less than 300 mv pp.

3.3.11.2 Zero Crossover (Null) Voltage. The zero crossover null voltage of the modulation envelope shall be less than 10 mv pp.

3.3.11.3 Lobe Mismatch. The difference between magnitudes of each successive half-cycle, of modulation envelope of each phase shall not exceed 10 percent of the magnitude of the greatest half-cycle of modulation envelope.

3.3.12 Encoder Phase Relationship. With the motor driven at a constant speed such that the CDU display is increasing, the Phase 2 modulation envelope of the encoder output shall lead the Phase 1 modulation envelope by 90° ±20°. With the motor driven at a constant speed such that the CDU display is decreasing, the Phase 2 modulation envelope of the encoder output shall lag the Phase 1 modulation envelope by 90° ±20°.

3.3.13 CDU Zeroing. CDU zeroing shall be as follows.

3.3.13.1 16 Speed Resolver Zero. With the CDU display driven to zero by means of the 16 Speed Resolver the CDU display shall indicate 000.000±0.001°.

3.3.13.2 Encoder Null. With the CDU display at zero, the in-phase 16 Speed Resolver output shall be 21.0±8.0 millivolts rms at the closest Phase 2 null points on each side of the CDU display zero.

3.3.13.3 1, 1/2, and 1/4 Speed Resolvers Zero Null. With the CDU display set to indicate 000.000±0.001°; the output voltages of the 1, 1/2, and 1/4 Speed Resolvers shall be as specified in Table III.

* Types I, II and IV only

3.3.4 Motor Starting Voltage. The in-phase voltage necessary to start and maintain motor shaft rotation shall not exceed 1.5V rms for Types I, III and IV, and 2.0V rms for Types II and V.

3.3.5 Motor Phasing. The CDU display shall increase when the control voltage is in-phase with the 0° reference and shall decrease when the control voltage is 180° out of phase with respect to the 0° reference.

3.3.6 Motor Speed. With rated voltage applied to all motor windings, the steady state motor speed shall be 11,000 ± 2500 rpm.

3.3.7 Tachometer Null. With the motor control voltage removed, the in-phase component of the tachometer output voltage shall be less than 4 mv rms, and the total tachometer voltage shall be less than 11 mv rms when the tachometer shaft is not rotating.

3.3.8 Tachometer Phasing. The tachometer output voltage shall be 180° out of phase with respect to the tachometer reference when the CDU display is increasing, and shall be in-phase with the tachometer reference when the CDU display is decreasing.

3.3.9 Motor Jog. With the motor shaft speed set at 50± 3 rpm, the variation from the set speed shall not exceed ±2 rpm.

3.3.10 Slew Voltage and Phasing For Types I, II and IV. With the SLEW switch set in the "INC" position, the slewing transformer output shall be 6.25±1.00V rms, and in phase with the zero degrees reference. With the SLEW switch set in the "DEC" position, the slewing transformer output voltage shall be 6.25±1.00V rms, and 180° out of phase with the zero degrees reference.

reference.

3.3.11 Encoder Output Characteristics. With the motor driven at a constant speed each phase of the encoder output shall have the following characteristics.

3.3.11.1 Modulation Envelope Magnitude. The magnitude of the modulation envelope shall be greater than 125 mv pp, but less than 300 mv pp.

3.3.11.2 Zero Crossover (Null) Voltage. The zero crossover null voltage of the modulation envelope shall be less than 10 mv pp.

3.3.11.3 Lobe Mismatch. The difference between magnitudes of each successive half-cycle, of modulation envelope of each phase shall not exceed 10 percent of the magnitude of the greatest half-cycle of modulation envelope.

3.3.12 Encoder Phase Relationship. With the motor driven at a constant speed such that the CDU display is increasing, the Phase 2 modulation envelope of the encoder output shall lead the Phase 1 modulation envelope by 90° ±20°. With the motor driven at a constant speed such that the CDU display is decreasing, the Phase 2 modulation envelope of the encoder output shall lag the Phase 1 modulation envelope by 90° ±20°.

3.3.13 CDU Zeroing. CDU zeroing shall be as follows.

3.3.13.1 16 Speed Resolver Zero. With the CDU display driven to zero by means of the 16 Speed Resolver the CDU display shall indicate 000.000±0.001°.

3.3.13.2 Encoder Null. With the CDU display at zero, the in-phase 16 Speed Resolver output shall be 21.0± .6 millivolts rms at [illegible] Phase 2 half points on each side of the CDU display zero.

3.3.13.3 1, 1/2, and 1/4 Speed Resolvers Zero Null. With the CDU display set to indicate 000.000±0.001° the output voltages of the 1, 1/2, and 1/4 Speed Resolvers shall be as specified in Table III.

WHEN OPERATED WITH 2V. 3200cps EXCITATION THE PIP WILL BEHAVE AS FOLLOWS:

1. A POSITIVE FLOAT ANGLE IS DEFINED TO BE WHEN THE SIGNAL GENERATOR Lo IS IN PHASE WITH RESPECT TO THE REFERENCE EXCITATION.
2. AN ACCELERATION ALONG THE POSITIVE INPUT AXIS RESULTS IN A NEGATIVE RATE OF CHANGE OF FLOAT ANGLE.
3. CURRENT FLOWING BETWEEN T+ AND TR RESULTS IN A POSITIVE RATE OF CHANGE OF FLOAT ANGLE AND IS DEFINED AS POSITIVE CURRENT.

WHEN OPERATED WITH THE INTERROGATE SWITCHING AND RESET PULSES FROM THE AGC, THE PULSE TORQUE ELECTRONICS WILL BEHAVE AS FOLLOWS:

AN INPUT SIGNAL Lo IN PHASE WITH THE REF. EXC. AND ABOVE 2.6V. PEAK TO PEAK APPLIED TO THE INTERROGATOR WILL RESULT IN A TM+SET PULSE BEING APPLIED TO THE CURRENT SWITCH. THE TM+SET PULSE APPLIED TO THE CURRENT SWITCH WILL RESULT IN POSITIVE CURRENT (+TORQUE) OUTPUT AND $-\Delta V$ PULSES.

WHEN OPERATED WITH 2V. 3200CPS. EXCITATION THE PIP WILL BEHAVE AS FOLLOWS:

1. A POSITIVE FLOAT ANGLE IS DEFINED TO BE WHEN THE SIGNAL GENERATOR Lo IS IN PHASE WITH RESPECT TO THE REFERENCE EXCITATION.
2. AN ACCELERATION ALONG THE POSITIVE INPUT AXIS RESULTS IN A NEGATIVE RATE OF CHANGE OF FLOAT ANGLE
3. CURRENT FLOWING BETWEEN T+ AND TR RESULTS IN A POSITIVE RATE OF CHANGE OF FLOAT ANGLE AND IS DEFINED AS POSITIVE CURRENT.

WHEN OPERATED WITH THE INTERROGATE AND SWITCHING PULSES FROM THE AGC OR BACK-UP MODE ELECTRONICS, THE PULSE TORQUE ELECTRONICS WILL BEHAVE AS FOLLOWS:

1. AN INPUT SIGNAL Lo IN PHASE WITH THE REF. EXC AND ABOVE 2.6V PEAK TO PEAK APPLIED TO THE INTERROGATOR, WILL RESULT IN A TM+SET PULSE BEING APPLIED TO THE CURRENT SWITCH. THE TM+SET PULSE APPLIED TO THE CURRENT SWITCH WILL RESULT IN POSITIVE CURRENT (+TORQUE) OUTPUT AND "N" PULSES. "N" PULSES TO THE FORWARD-BACKWARD COUNTER GIVES -ΔV PULSES TO THE AGC.

WHEN OPERATED WITH WHEEL VOLTAGE E_{WA} LEADING E_{WB} BY 90° AND A VOLTAGE E_m IMPRESSED, THE GYRO WILL BEHAVE AS FOLLOWS:

1. A POSITIVE ANGULAR DISPLACEMENT OF THE GYRO CASE ABOUT IA WILL CAUSE A VOLTAGE e_{SG} TO APPEAR WHICH WILL BE IN PHASE WITH E_m.
2. A CURRENT i_T INTO T+ WILL CAUSE A POSITIVE FLOAT ROTATION ABOUT OA WITH RESPECT TO THE CASE. THIS WILL CAUSE A VOLTAGE e_{SG} TO APPEAR WHICH WILL BE IN PHASE WITH E_m. THIS WILL REQUIRE A NEGATIVE ANGULAR VELOCITY OF THE CASE ABOUT IA (POSITIVE ANGULAR VELOCITY ABOUT -IA) TO KEEP THE SIGNAL GENERATOR NEAR NULL.

POLARITIES SHOWN INDICATE IN PHASE ⊕ OR OUT OF PHASE ⊖ AC VOLTAGES WITH RESPECT TO THE MICROSYN EXCITATION, AND PLUS ⊕ OR MINUS ⊖ DC VOLTAGES. THE POLARITIES SHOWN WILL APPEAR AS A RESULT OF DISTURBANCES OF THE STABLE MEMBER ABOUT +IGA, +MGA, OR +OGA WHEN THE GIMBALS ARE INITIALLY NEAR ZERO REFERENCE POSITIONS.

WHEN OPERATED WITH WHEEL VOLTAGE E_{WA} LEADING E_{WB} BY 90° AND A VOLTAGE E_M IMPRESSED, THE GYRO WILL BEHAVE AS FOLLOWS:

1. A POSITIVE ANGULAR DISPLACEMENT OF THE GYRO CASE ABOUT IA WILL CAUSE A VOLTAGE e_{SG} TO APPEAR, WHICH WILL BE IN PHASE WITH E_M
2. A CURRENT i_T INTO T+ WILL CAUSE A POSITIVE FLOAT ROTATION ABOUT OA WITH RESPECT TO THE CASE. THIS WILL CAUSE A VOLTAGE e_{SG} TO APPEAR, WHICH WILL BE IN PHASE WITH E_M. THIS WILL REQUIRE A NEGATIVE ANGULAR VELOCITY OF THE CASE ABOUT IA (POSITIVE ANGULAR VELOCITY ABOUT -IA) TO KEEP THE SIGNAL GENERATOR NEAR NULL.
